COMPUTING

If you have a client who is interested in a career in computing, what kinds of programs and jobs do you think of?

FIRST WORDS THAT COME TO MIND?

7

8

**MOST DON'T KNOW EXACTLY
WHAT THEY'RE GETTING INTO**

9

**BUT THEY DO HAVE AN IDEA OF
WHY THEY WANT TO BE IN COMPUTING**

INFORMATION SYSTEM

Information Systems (IS) is focused on integrating information technology and business processes.

IS professionals require a sound understanding of business practices.

They can serve as an effective bridge between the management and technical communities within an organization.

IS programs are often located within business faculties.

IS programs can exist under different labels.

For example, Computer Information Systems (CIS) programs have a larger technology focus ...

... while programs in Management Information Systems (MIS) emphasize more the business and organizational aspects of IS.

Let's take a closer look at what one does in Information Systems ...

INFORMATION SYSTEM

Information Systems (IS) professionals combine business and technical knowledge.

We view technology as an instrument for generating, processing, and distributing information.

We are interested in the information that computer systems can provide to aid an enterprise in achieving its goals.

We tailor application technologies (especially databases) to the needs of the organization.

We can be involved in system deployment and the training of users.

We are often the interface between the end users and the technical experts.

Later in our careers we may manage a team of developers on a software project.

In Information Technology, we are also interested in the applied side of computing.

In Software Engineering, we manage large software projects.

37

INFORMATION TECHNOLOGY

Information Technology (IT) programs prepare students to meet the computer technology needs of businesses and other organizations.

IT is a new field and its programs exist under different labels (that is, they may not use the IT label in their name).

IT specialists select hardware and software products and ...

... install, customize, and maintain those products for a variety of organizations and users.

They are especially focused on applying and integrating a wide-range of technical skills.

Let's take a closer look at Information Technology tasks ...

INFORMATION TECHNOLOGY

In Information Technology we are principally focused on how to configure, use, and support technology infrastructures within organizations.

Organizations are dependent upon information technology and IT professionals help support it.

We understand computer systems and their software and help to solve computer-related problems.

We possess a combination of theoretical knowledge and practical, hands-on expertise.

We also do software development, especially in applied areas such as web sites and mobile apps.

We can help configure and improve an organization's security infrastructure.

We install, customize, and maintain both applications and devices for an organization and its users.

This means we can take care of an organization's information technology infrastructure.

In Information Systems, we are mainly interested in the business aspects of information technology.

In Computer Engineering, we are also interested in hardware, but we focus on designing and creating it.

38

SOFTWARE ENGINEERING

Software Engineering (SE) is the discipline of developing and maintaining large software systems.

SOFTWARE ENGINEERING

In Software Engineering (SE) we are focused on how to best develop reliable large-scale software systems.

Degree programs in Computer Science and in Software Engineering have many courses in common.

SE students learn about software reliability and maintainability.

They learn best practices for engineering software applications.

Some SE programs are within Engineering departments ...

... while others are specialties within Computer Science.

They experience teamwork and focus on effective project management processes.

Let's take a closer look at what a software engineer can do ...

We use special design techniques so that software is more likely to be reliable and correct.

We are interested in learning and improving software design principles.

We also develop new testing techniques to create safer software.

We may supervise a team of developers.

We need to be able to assess user needs and develop usable software.

We are often engineers, which means we also have traditional engineering skills and training.

Our engineering perspective allows us to look deep inside complex software systems.

We sometimes do many of these same tasks over in Computer Science as well.

Computer Engineering has some similarities, but we are more focused on the connection between software and hardware.

39

COMPUTER ENGINEERING

Summary

Computer Engineering is focused on computer architecture and infrastructure, from the applied to the theoretical aspects. It also has an interest in software methods (programming) and/or in applying to the hardware side of computing.

On the Job

- Design hardware to implement communication systems.
- Develop hardware devices that are software-controlled, such as chips, smart phones and gaming systems.
- Focuses exclusively on hardware design, including digital electronics, with less investment in software design.
- Evaluate and improve the usability (user experience) of computing systems.

Core Courses

- Circuits and Electronics
- Computer Architecture and Organization
- Computer Networks
- Control Systems
- Data and Systems Communications
- Data Structures and Algorithms
- Digital Design
- Embedded Systems
- Information Security
- Internet of Things
- Signal Processing
- Software Design

Sample Degrees

- University of Western Ontario, Bachelor of Engineering Science in Computer Engineering
- University of British Columbia, Bachelor of Applied Science in Computer Engineering
- University of Alberta, Bachelor of Engineering in Computer Engineering
- McGill University, Bachelor of Engineering in Computer Engineering
- University of Waterloo, Bachelor of Applied Science in Computer Engineering
- University of Saskatchewan, Bachelor of Engineering - Computer Engineering
- St. Mary's University, Bachelor of Engineering - Electronic Systems Engineering
- Queen's University, Bachelor of Engineering in Computer Engineering

Other Pathways

- Sherridan College, Computer Engineering Technology Diploma - 2 years
- Seneca College, Computer Engineering Technology Diploma - 2 years
- George Brown College, Computer Systems Technology (Advanced Diploma) - 2 years
- Chungking College, Electronic Engineering Technology Diploma - 2 years
- University of Ontario Institute of Technology, Computer Engineering Technology Diploma - 2 years
- St. Mary's University, Bachelor of Engineering - Electronic Systems Engineering
- Queen's University, Bachelor of Engineering in Computer Engineering

Outside and Inside Our Great City: Helping Career Advisors Understand Computing

By Randy Connolly, Mount Royal University

When you first arrive in an unfamiliar city, your attention will likely be drawn to the outside features of the notable buildings around you. But for the long-term inhabitants of that city, what matters most are the activities occurring within those buildings. This discrepancy between the outside and inside is the analogous situation facing career advisors when they endeavor to guide their clients towards a computing career. Their clients ultimately decide to pursue a computing education based on what they imagine happens inside those buildings, but the advisors generally only have the outside perspective of a tourist. We have created a handbook to help both career advisors and potential students better understand both the inside and the outside of different computing careers and disciplines.

INTRODUCTION
How do we encourage prospective students to consider enrolling in an educational program that will prepare a student adequately for a future computing career? During the harrowing enrollment crisis of the first decade of the 2000s, the answer to this question had existential urgency for almost everyone in computing education. In this past decade, the problem has lost some of its urgency due to strong and steadily increasing application numbers within computing [15]. Yet despite these rosy trends, the answer to this question remains uncertain. For some, it's an issue wrapped up in the more generalized concern of getting more students to enroll within STEM programs for the good of the economy. For others, it's about maintaining growth within their discipline. But for career counselors and advisors, the interest in this question lies principally in their concern for how best to guide their clients onto a rewarding career path. We know that computing can be rewarding, and that economic demand will likely remain strong for some time. But what is a computing career? How does one prepare for it? Back in 2005, Anthony noted that there was "confusion in industry as well as among students and parents in relation to what various computing programs offer and prepare students for" [2] in the intervening 17 years, the variety within computing ed-
